

## ABSTRACT OF THE DISCLOSURE

Disclosed is a system for generating a graphics window that is capable of emulating enhanced video from a combined video and interactive content stream. The set-top emulator can randomly access the combined video and interactive content stream to provide an easy manner of randomly accessing portions of the combined video and interactive stream for quality control purposes. Random access allows selective viewing of the enhanced video which saves time. Additionally, the combined video and interactive content stream can be simultaneously viewed as it is being produced to allow immediate feedback to an interactive television producer.
